## TECHNOLOGIES

### Patented *Plant Growth Technology*

“ihammer's products represent the single largest advancement in the reduction of global climate change on the planet, and they have been shown to help plants turn carbon into plant growth by as much as 20% compared to controls. In addition, this enormous advancement enables plants to make substantially more sugars. This in turn means that turf can substantially increase root length, density, strengthen tillers and reduce overall plant stress. In agriculture, each acre of row crops treated in this way can substantially convert sugars creating maximum food and fiber yields. Every sustainable energy crop, including algae, makes the most of carbon sequestration into fuel. Thus each acre of treated turf and crops is able to reduce its pollution by the exact same amount.” ihammer's products for turf, ornamentals, horticulture, and agriculture are:

### MegAleX®, Upplause®, & Upplause® Plus
